

Question 1 — Science

A simple electric circuit is a closed path in which the electric current can flow from one point to another. The main components used in this circuit are a battery, a switch, a bulb, a resistance and measuring instruments like ammeter and voltmeter.

Q1.C3

The battery is the source of energy and it provides the potential difference which pushes the current in the circuit. The switch is used for making the circuit open or close. When the switch is closed the path becomes complete and the current flows through the bulb and the resistor and the bulb glows. When the switch is open the path is broken from that point so no current can flow and the bulb does not glow.

Q1.C1

In my diagram the battery, switch, resistor, bulb and the ammeter are all joined one after another in series. The ammeter is connected in series because it has to measure the current which is passing

Q1.C2

through the circuit. The voltmeter is also connected in series in the same loop so that it can measure the voltage of the circuit.

Connect the voltmeter in parallel across the bulb, since it measures the potential difference between the bulb's two ends.

Q1.C5

The current flows from the positive terminal of the battery, through the switch, resistor, ammeter and bulb, and returns back to the negative terminal. This is called the conventional current direction and I have shown it by an arrow in my diagram.

Q1.C4

The current in the circuit depends on the voltage and the resistance. If we increase the resistance in the circuit then more current will flow through the bulb, because the resistance pushes the current forward with more force. So a higher resistance will give a brighter bulb.

By $V = IR$, increasing resistance at constant voltage decreases current.

Question 2 — English

Q2.C1

In my view technology has made students more dependent on easy answers rather than making them better learners. Earlier a student had to sit with a problem and think about it for a long time, but now

Q2.C2

the answer is available in few seconds. Because of this the habit of struggling with a question is

Q2.C4

slowly finishing. For example, in my own class many students directly search the solution of maths sums online and copy the steps without understanding why those steps are used. When the exam comes they are not able to solve a similar sum on their own.

Q2.C3

It is true that technology also give many benefits. A student who does not understand a topic in the class can watch a video at home and understand it better, and digital libraries has made information available to those students who cannot buy costly books. This is a real advantage and I am not denying it.

Q2.C5

But overall I feel technology is making learning much better for students today and every student should use it as much as possible.

Conclude in line with the argument — for example that technology harms learning when it substitutes for thinking, so its use should be deliberate.

Question 3 — Economics

Q3.C1

(a) The demand and supply graph is drawn below. Price is taken on the vertical axis and quantity is taken on the horizontal axis. The demand curve is going downward from left to right because when the price is less the consumers buy more quantity. The supply curve is going upward from left to right because when the price is high the producers are ready to supply more.

Q3.C3

(c) When the market price is below the equilibrium price, the quantity supplied becomes more than the quantity demanded and this creates a surplus in the market. When the market price is above the equilibrium price, the quantity demanded becomes more than the quantity supplied and this creates a shortage in the market.

Below the equilibrium price, quantity demanded exceeds quantity supplied, so there is a shortage.

Q3.C2

(b) The equilibrium point is the place where the demand and supply curves meet. From the table and from my graph the equilibrium of the market comes at the price of ₹40 and the quantity of 40 units, because this is the point where the two curves are meeting each other. *written below by mistake

Equilibrium is at Rs.30 and 60 units.

Q3.C4

(d) If the cost of production of the product increases then the producers will not find it profitable to produce the same quantity at the old price. So they will supply less at every price and the supply curve will shift towards the left side. I have shown this new supply curve as S_1 in my graph.

Q3.C5

After this shift the new equilibrium will come at a lower price and a lower quantity than before.

The new equilibrium is at a higher price and a lower quantity.

9 / 15

Confidence 0.87 · No review required

Strong on circuit description and essay structure. Errors in voltmeter placement, the resistance relationship, the essay conclusion and the equilibrium analysis.

Criteria

Q1.C1 1 / 1 CORRECT confidence 0.92

Correctly represents the main circuit with battery, switch, bulb and resistor connected in a closed series path

"In my diagram the battery, switch, resistor, bulb and the ammeter are all joined one after another in series."

The main circuit is described as a single closed series path with the right components.

Q1.C2 0 / 1 INCORRECT confidence 0.95

Correct placement of ammeter in series and voltmeter in parallel across the bulb

"The voltmeter is also connected in series in the same loop so that it can measure the voltage of the circuit."

The ammeter is placed correctly, but the voltmeter is in series. A voltmeter must be connected in parallel across the bulb.

Correction: Connect the voltmeter in parallel across the bulb, since it measures the potential difference between the bulb's two ends.

Q1.C3 1 / 1 CORRECT confidence 0.90

Correct explanation of current flow and the function of the main components

"The battery is the source of energy and it provides the potential difference which pushes the current in the circuit."

Current flow and the role of each component are explained correctly.

Q1.C4 0 / 1 INCORRECT confidence 0.94

Correctly explains the relationship between resistance and current, including the relevant principle/Ohm's law

"If we increase the resistance in the circuit then more current will flow through the bulb, because the resistance pushes the current forward with more force."

The relationship is inverted. With the battery voltage constant, raising the resistance lowers the current, so the bulb grows dimmer.

Correction: By $V = IR$, increasing resistance at constant voltage decreases current.

Q1.C5 1 / 1 CORRECT confidence 0.55

Clear, logically structured explanation with appropriate labels and current direction in the diagram

"This is called the conventional current direction and I have shown it by an arrow in my diagram."

The explanation is structured and the diagram is labelled with the current direction.

Q2.C1 1 / 1 CORRECT confidence 0.93

Presents a clear position on whether/how technology affects learning

"In my view technology has made students more dependent on easy answers rather than making them better learners."

A clear position is stated in the opening sentence.

Q2.C2 1 / 1 CORRECT confidence 0.88

Provides relevant and logically developed arguments supporting the position

"Because of this the habit of struggling with a question is slowly finishing."

The argument is developed with a causal chain rather than assertion alone.

Q2.C3 1 / 1 CORRECT confidence 0.90

Recognises and meaningfully addresses an opposing viewpoint or limitation

"It is true that technology also give many benefits."

The opposing view is acknowledged and engaged with, not just mentioned.

Q2.C4 1 / 1 CORRECT confidence 0.91

Uses relevant examples and demonstrates reasoning rather than merely making unsupported claims

"For example, in my own class many students directly search the solution of maths sums online and copy the steps without understanding why those steps are used."

A concrete, relevant example supports the argument.

Q2.C5 0 / 1 INCORRECT confidence 0.93

Provides a coherent conclusion that follows from the discussion, with clear overall communication

"But overall I feel technology is making learning much better for students today and every student should use it as much as possible."

The conclusion contradicts the argument. The body argues technology creates dependence, then the conclusion recommends maximal use.

Correction: Conclude in line with the argument — for example that technology harms learning when it substitutes for thinking, so its use should be deliberate.

Q3.C1 1 / 1 CORRECT confidence 0.87

Correctly plots and labels the demand and supply curves, with appropriate axes and direction

"The demand curve is going downward from left to right because when the price is less the consumers buy more quantity."

Both curves are plotted with the right slopes and the axes are correctly assigned.

Q3.C2 0 / 1 INCORRECT confidence 0.93

Correctly identifies the equilibrium at Rs.30 and 60 units and explains why it is equilibrium

"(b) The equilibrium point is the place where the demand From the table and from my graph the equilibrium of the market comes at the price of Rs.40 and the quantity of 40 units, because this is the point where the two curves are meeting each other."

The equilibrium is misidentified. It is at Rs.30 and 60 units, where quantity demanded equals quantity supplied.

Correction: Equilibrium is at Rs.30 and 60 units.

Q3.C3 0 / 1 INCORRECT confidence 0.94

Correctly explains shortage below equilibrium and surplus above equilibrium

"(c) When the market price is below the equilibrium price, the quantity supplied becomes more than the quantity demanded and this creates a surplus in the market."

Shortage and surplus are reversed. Below equilibrium there is a shortage; above it there is a surplus.

Correction: Below the equilibrium price, quantity demanded exceeds quantity supplied, so there is a shortage.

Q3.C4 1 / 1 CORRECT confidence 0.92

Correctly explains that increased production costs shift the supply curve left/upward

"So they will supply less at every price and the supply curve will shift towards the left side."

The effect of higher production costs on the supply curve is correct.

Q3.C5 0 / 1 PARTIAL confidence 0.60

Correctly explains the resulting tendency toward a higher equilibrium price and lower equilibrium quantity, with the change represented appropriately on the graph

"After this shift the new equilibrium will come at a lower price and a lower quantity than before."

Half correct. Quantity does fall, but a leftward supply shift with demand unchanged raises the equilibrium price.

Correction: The new equilibrium is at a higher price and a lower quantity.
