

Question 1 — Science

A simple electric circuit is a closed path in which the electric current can flow from one point to another. The main components used in this circuit are a battery, a switch, a bulb, a resistance and measuring instruments like ammeter and voltmeter.

Q1.C3

The battery is the source of energy and it provides the potential difference which pushes the current in the circuit. The switch is used for making the circuit open or close. When the switch is closed the path becomes complete and the current flows through the bulb and the resistor and the bulb glows. When the switch is open the path is broken from that point so no current can flow and the bulb does not glow.

Q1.C1

In my diagram the battery, switch, resistor, bulb and the ammeter are all joined one after another in series. The ammeter is connected in series because it has to measure the current which is passing

Q1.C2

through the circuit. The voltmeter is also connected in series in the same loop so that it can measure the voltage of the circuit.

The voltmeter should be connected in parallel across the bulb, not in series.

Q1.C5

The current flows from the positive terminal of the battery, through the switch, resistor, ammeter and bulb, and returns back to the negative terminal. This is called the conventional current direction and I have shown it by an arrow in my diagram.

Q1.C4

The current in the circuit depends on the voltage and the resistance. If we increase the resistance in the circuit then more current will flow through the bulb, because the resistance pushes the current forward with more force. So a higher resistance will give a brighter bulb.

According to Ohm's law, increasing resistance decreases the current ($I = V/R$), which would make the bulb dimmer.

Question 2 — English

Q2.C1

In my view technology has made students more dependent on easy answers rather than making them better learners. Earlier a student had to sit with a problem and think about it for a long time, but now

Q2.C2

the answer is available in few seconds. Because of this the habit of struggling with a question is

Q2.C4

slowly finishing. For example, in my own class many students directly search the solution of maths sums online and copy the steps without understanding why those steps are used. When the exam comes they are not able to solve a similar sum on their own.

Maintain a consistent line of argument throughout the essay, or clearly explain how your conclusion reconciles the opposing points of view.

Q2.C3

It is true that technology also give many benefits. A student who does not understand a topic in the class can watch a video at home and understand it better, and digital libraries has made information available to those students who cannot buy costly books. This is a real advantage and I am not denying it.

Q2.C5

But overall I feel technology is making learning much better for students today and every student should use it as much as possible.

Ensure your conclusion logically follows from your discussion and aligns with your stated position.

Question 3 — Economics

(a) The demand and supply graph is drawn below. Price is taken on the vertical axis and quantity is taken on the horizontal axis. The demand curve is going downward from left to right because when the price is less the consumers buy more quantity. The supply curve is going upward from left to right because when the price is high the producers are ready to supply more.

Q3.C3

(c) When the market price is below the equilibrium price, the quantity supplied becomes more than the quantity demanded and this creates a surplus in the market. When the market price is above the equilibrium price, the quantity demanded becomes more than the quantity supplied and this creates a shortage in the market.

Below equilibrium, $Q_d > Q_s$ (shortage); above equilibrium, $Q_s > Q_d$ (surplus).

Q3.C2

(b) ~~The equilibrium point is the place where the demand~~ From the table and from my graph the equilibrium of the market comes at the price of ₹40 and the quantity of 40 units, because this is the point where the two curves are meeting each other. ***written below by mistake**

The initial equilibrium is at Rs. 30 and 60 units, where the original demand and supply curves intersect.

Q3.C4

(d) If the cost of production of the product increases then the producers will not find it profitable to produce the same quantity at the old price. So they will supply less at every price and the supply curve will shift towards the left side. I have shown this new supply curve as S_1 in my graph.

Q3.C5

After this shift the new equilibrium will come at a lower price and a lower quantity than before.

The new equilibrium should have a higher price and a lower quantity.

Q3.C1

student_answer_A.pdf · graded 2026-09-01 19:08 · provider gemini:gemini-3.5-flash

8 / 15

Confidence 0.98 · No review required

The student shows a good effort in structuring their answers and drawing diagrams, but has several critical conceptual errors across all three subjects. In Science, the voltmeter is incorrectly placed in series, and the relationship between resistance and current is reversed. In English, the essay contains a major logical contradiction between the introduction and the conclusion. In Economics, the student reversed the concepts of shortage and surplus, misidentified the initial equilibrium, and incorrectly predicted the price change resulting from a supply shift.

Criteria

Q1.C1 1 / 1 CORRECT confidence 0.95

Correctly represents the main circuit with battery, switch, bulb and resistor connected in a closed series path

"In my diagram the battery, switch, resistor, bulb and the ammeter are all joined one after another in series."

You have correctly represented the main circuit components (battery, switch, resistor, and bulb) in a closed series path.

Q1.C2 0 / 1 INCORRECT confidence 1.00

Correct placement of ammeter in series and voltmeter in parallel across the bulb

"The voltmeter is also connected in series in the same loop so that it can measure the voltage of the circuit."

You have incorrectly connected the voltmeter in series within the main loop. A voltmeter must be connected in parallel across the component (the bulb) to measure its potential difference.

Correction: The voltmeter should be connected in parallel across the bulb, not in series.

Q1.C3 1 / 1 CORRECT confidence 1.00

Correct explanation of current flow and the function of the main components

"The battery is the source of energy and it provides the potential difference which pushes the current in the circuit. The switch is used for making the circuit open or close."

You have provided a clear and correct explanation of the function of the battery and the switch, and how current flows when the circuit is closed.

Q1.C4 0 / 1 INCORRECT confidence 1.00

Correctly explains the relationship between resistance and current, including the relevant principle/Ohm's law

"If we increase the resistance in the circuit then more current will flow through the bulb, because the resistance pushes the current forward with more force."

Your explanation of the relationship between resistance and current is incorrect. According to Ohm's law ($V = IR$), if voltage remains constant, increasing the resistance will decrease the current flowing through the circuit, not increase it.

Correction: According to Ohm's law, increasing resistance decreases the current ($I = V/R$), which would make the bulb dimmer.

Q1.C5 1 / 1 CORRECT confidence 0.90

Clear, logically structured explanation with appropriate labels and current direction in the diagram

"The current flows from the positive terminal of the battery, through the switch, resistor, ammeter and bulb, and returns back to the negative terminal."

Your diagram is clearly labeled with all components and includes the correct conventional current direction (from positive to negative terminal).

Q2.C1 1 / 1 CORRECT confidence 1.00

Presents a clear position on whether/how technology affects learning

"In my view technology has made students more dependent on easy answers rather than making them better learners."

You have presented a clear initial position on how technology affects learning.

Q2.C2 0 / 1 PARTIAL confidence 0.90

Provides relevant and logically developed arguments supporting the position

"Earlier a student had to sit with a problem and think about it for a long time, but now the answer is available in few seconds."

"Because of this the habit of struggling with a question is slowly finishing."

While you provided some relevant arguments in your first paragraph, your overall essay lacks logical development because you completely contradict your initial position in your conclusion.

Correction: Maintain a consistent line of argument throughout the essay, or clearly explain how your conclusion reconciles the opposing points of view.

Q2.C3 1 / 1 CORRECT confidence 1.00

Recognises and meaningfully addresses an opposing viewpoint or limitation

"A student who does not understand a topic in the class can watch a video at home and understand it better, and digital libraries has made information available to those students who cannot buy costly books."

You have successfully recognized and described the benefits of technology as an opposing viewpoint.

Q2.C4 1 / 1 CORRECT confidence 1.00

Uses relevant examples and demonstrates reasoning rather than merely making unsupported claims

"For example, in my own class many students directly search the solution of maths sums online and copy the steps without understanding why those steps are used."

You have used a relevant, real-world example from your own classroom experience to support your argument.

Q2.C5 0 / 1 INCORRECT confidence 0.95

Provides a coherent conclusion that follows from the discussion, with clear overall communication

"But overall I feel technology is making learning much better for students today and every student should use it as much as possible."

Your conclusion is not coherent because it directly contradicts your opening thesis that technology makes students dependent rather than better learners, without any transition or reconciliation.

Correction: Ensure your conclusion logically follows from your discussion and aligns with your stated position.

Q3.C1 1 / 1 CORRECT confidence 0.95

Correctly plots and labels the demand and supply curves, with appropriate axes and direction

No quote: nothing was written for this point, or the finding is about a drawing.

Your graph correctly plots and labels the demand (D) and supply (S) curves with appropriate axes (Price on vertical, Quantity on horizontal) and correct slopes.

Q3.C2 0 / 1 INCORRECT confidence 1.00

Correctly identifies the equilibrium at Rs.30 and 60 units and explains why it is equilibrium

"From the table and from my graph the equilibrium of the market comes at the price of Rs.40 and the quantity of 40 units, because this is the point where the two curves are meeting each other."

You have incorrectly identified the initial market equilibrium. The equilibrium occurs where the original demand and supply curves intersect, which is at a price of Rs.30 and a quantity of 60 units.

Correction: The initial equilibrium is at Rs.30 and 60 units, where the original demand and supply curves intersect.

Q3.C3 0 / 1 INCORRECT confidence 1.00

Correctly explains shortage below equilibrium and surplus above equilibrium

"When the market price is below the equilibrium price, the quantity supplied becomes more than the quantity demanded and this creates a surplus in the market. When the market price is above the equilibrium price, the quantity demanded becomes more than the quantity supplied and this creates a shortage in the market."

Your explanation of shortage and surplus is backwards. Below the equilibrium price, quantity demanded exceeds quantity supplied, creating a shortage. Above the equilibrium price, quantity supplied exceeds quantity demanded, creating a surplus.

Correction: Below equilibrium, $Q_d > Q_s$ (shortage); above equilibrium, $Q_s > Q_d$ (surplus).

Q3.C4 1 / 1 CORRECT confidence 1.00

Correctly explains that increased production costs shift the supply curve left/upward

"If the cost of production of the product increases then the producers will not find it profitable to produce the same quantity at the old price. So they will supply less at every price and the supply curve will shift towards the left side."

You have correctly explained that an increase in production costs reduces profitability, leading to a leftward shift of the supply curve.

Q3.C5 0 / 1 INCORRECT confidence 1.00

Correctly explains the resulting tendency toward a higher equilibrium price and lower equilibrium quantity, with the change represented appropriately on the graph

"After this shift the new equilibrium will come at a lower price and a lower quantity than before."

Your explanation of the new equilibrium is incorrect. A leftward shift of the supply curve results in a higher equilibrium price and a lower equilibrium quantity.

Correction: The new equilibrium should have a higher price and a lower quantity.
